Abstract

Web applications are increasing in the computing environment. Traditionally you would load computer software applications locally on every system. Even with automated software deployment systems, can still be support intensive. With web applications you can load applications just once on a server and let all users access the applications as they need them via a web browser. You also only have to update only one system as improvements to software become available. This can be a tremendous savings in support time devoted to software deployment.

Introduction

Web page that view programs that IT student which he/she need to install it in his/her personal laptop without tacking to the technicians. In this project we display a lot of things for user such as the student- id , password , level. So help students to go inside the site and do operation such as: install the programs that need for IT courses , without helped from technician.

Conclusion:

We hope that this project gains the satisfaction for the user .We also hope that it will be useful and gainful for all levels of student .We recommend that students go through it and make new and better than it . The main idea of our project is to design website which required in our educational life which facilitate installing process of programs and make it faster. We encourage students to develop more web site which is helpful for all .
